

Light that travels with the work

A small reading light for people who work between a desk, a studio and a train. The object should feel useful before it feels technical.

01 / Proportion study. This diagram is not a fabrication drawing.

What matters

A full workday should fit in one charge.

Every surface uses a glossy finish.

The hinge should move with one hand and hold its position when the table shakes. Keep the controls quiet: one switch and a dimming gesture.

Make the constraints visible

These provisional numbers are inputs for discussion. They are not performance claims.

Constraint	Working target	Next check
Mass	320 g	Weigh the first assembly
Working time	8 hours	Measure at reading brightness
Packed height	28 mm	Check hinge clearance
Repair	Four screws	Time a battery replacement

One question for the next prototype

Does the wide base make the light feel calmer, or does it make it less likely to travel?

Build both base widths with the same head and hinge. Put them in a bag, use them at a narrow table, and record what changes in the experience.

Keep the test simple. Compare one geometric change at a time. Carry the source, dimensions and observations into the next revision.

Decisions worth keeping

Use a note to say what should change, what should stay, or what still needs an answer.

Change

Replace a vague promise with a condition that can be checked on a real prototype.

Keep

Preserve the compact folded outline while exploring the base width.

Question

Who should be able to repair the light, and which tools will they have?
